

Shangda Superalloys Materials Co., Ltd.

### "Prospering the Nation through Materials" Scholarship Program

To deeply fulfill the mission of "Prospering the Nation through Materials" and align closely with the national strategic development plan for new materials, Shangda Superalloys Materials Co., Ltd. (hereinafter referred to as "our company"), in partnership with the Qinghe County Education Foundation, Qinghe High School, and Qinghe Zhizhen School, has implemented the "Prospering the Nation through Materials" Scholarship Program for many consecutive years. With the core tenet of "Building Dreams, Cultivating Talent, and Supporting Education," this program represents a significant initiative by our company to integrate industrial advantages, give back to the local education system, and cultivate high quality talent. It aims to establish a complete talent development chain of "Supporting Education — Cultivating Talent — Giving Back," injecting youthful energy into the high-quality development of the materials industry.

As a targeted public welfare project for students from Qinghe County, the scholarship program has clear implementation criteria: each year, it selects college students who have gained entry to key national universities (such as 985/211, Double First Class universities) and are pursuing majors closely related to high-quality materials and advanced manufacturing, including Metallurgical Engineering, Metallic Materials, Mechanical Engineering, Electrical Engineering, and Computer Science & Technology. Beyond financial assistance, the program provides scholarship recipients with opportunities for company visits, internships, and practical training, building a platform integrating industry, academia, and research. It offers priority employment opportunities, facilitating the precise alignment of classroom knowledge with industrial needs, and helps students grow into pillars of society with both professional competence and patriotic dedication.

As a leading enterprise in the domestic superalloy field, our company is a national high-tech enterprise and a key national "Specialized, Refined, Distinctive, and Innovative" "Little Giant" enterprise. It hosts a National Enterprise Technology Center and multiple other research platforms. Our products are used in high-quality equipment manufacturing fields such as aerospace, gas turbines, and nuclear engineering. Our company holds numerous core technologies and has achieved import substitution. The implementation of the scholarship program profoundly reflects our company's responsibilities and mission: For the nation, it aligns with the strategy of becoming a "Materials Power," specifically addressing the talent shortage in critical fields like superalloys, thereby building a reserve of talent to overcome "bottleneck" technologies. For the local community, it gives back to Qinghe's education system, encouraging local students to excel in engineering disciplines, thus accumulating talent for the development of the regional new materials industry. For the students, it alleviates financial pressure, clarifies career paths, and provides a broad platform for growth and development.

In the future, our company will continue to deepen the "Prospering the Nation through Materials" Scholarship Program, tirelessly fulfilling its social responsibilities. By connecting education and industry with corporate power, our company will enable more young talents to

become the core strength of a "Materials Power," writing a vibrant chapter of youth in the journey of national rejuvenation.
